nguyentanhoit@gmail.com

SUMMARY

Passionate and self-motivated learner. My professional experience as an R&D engineer in academic environment with expertise in deep learning research and building prototypes to drive machine learning to solve real problems. As a recent Computer Science graduate, I am seeking an entry-level position to pursue a career as a Deep Learning Engineer/ MLOps Engineer.

TECHNICAL SKILLS

Programming languages | frameworks
Python (SciKit-Learn, Pandas, NumPy), Matlab, Tensorflow, OpenCV

Machine Learning:
Classification, Clustering, Regression, CNN, Neural Network

Web-API
Flask, Django, HTML, CSS, JavaScript, Ajax, Streamlit

Visualization
Python (Matplotlib, Seaborn), Plotly.

LANGUAGES

English
Working Proficiency

Japanese
Elementary

Vietnamese
Native

EDUCATION

MSc in Applied Informatic at HOSEI University 2019/09 – 2021/09
GPA: 3.6/4.0 Tokyo, Japan
- A scientific paper got accepted and presented at a top conference (IEEE MMSP2021).
- Academic scholarships (Jasso, Daddy-Longleg) for students with good achievements.

BSc in Computer Science at University of Information Technology 2014/09 – 2019/06
Ho Chi Minh, Vietnam
- Thesis Grade: 9.8/10 - Top 1 highest grade in thesis defense UIT 2018
- Academic scholarship for Top 5% students of Academic Excellence 2018

SELECTED PROJECTS

MOEMO: Measuring Student Engagement in the Online Course 2021/03 – Present
R&D Engineer at Research Center for Computing & Multimedia Studies, Hosei Univ.

This project was developed to provide a solution of smart learning analytics system to measure student engagement in online environments.

My role:
- Designed the system pipeline, planned tasks list, and assigned appropriate tasks to team members.
- Implemented Deep learning-based methods such as Face recognition, Eye detection, Eye Gaze estimation, Emotion recognition to capture student features.
- Developed a prototype web application for the learning analysis using Flask RestfulAPI, SQLite3, Plotly.
- Co-oped with a data scientist to visualize the analytics results on the dashboard.

(View demos in Portfolios)

SpeedDeblur: A Framework to speed up CNN-based Deblurring for HEVC compressed video 2020/12 – 2021/07

Researcher at Intelligent Media Processing Laboratory, Hosei Univ.

This framework was designed and developed to reduce the processing time of Deep learning-based deblurring algorithms by up to 4.0× and 99.4× on GPU and CPU, respectively. This work was accepted by **IEEE MMSP 2021.**

My role:

- Proposed a novel strategy to generate blurry videos from the raw ones.
- Designed SpeedDeblur framework which can speed up the deblurring processing time by utilizing the coded information from the encoder.
- Implemented the state-of-the-art CNN-based deblurring algorithms from paper.
- Collected and processed data for training deblurring algorithms.
- Trained models and evaluated performance of SpeedDeblur compared with other state-of-the-art methods. (using PSNR, MSE metric).

(View demos in Portfolios)

EyeTeck: A monitoring system to search people in surveillance camera network 2018/01 – 2018/07

Research Assistant at Multimedia Communications Laboratory, VNUHCM-UIT

This project was developed to provide a solution of the smart monitoring system to search people in surveillance camera networks. This work scored 9.8 for a bachelor thesis and got in the top 10 teams semifinal in Creative ideas for the smart city - Binh Duong Competition 2018, Vietnam.

My role:

- Implemented Machine Learning methods such as face detection, face recognition, face clustering, pedestrian detection to capture features.
- Trained VGG16 on the BETA dataset for person attribute recognition.
- Designed and developed a prototype web app for monitoring, searching and re-identifying people using face, cluster, or person information.
- Collected recorded video data and evaluated the system on face recognition.
